

Technical Assessment

Employee Management System — CRUD Application

Time allotted: 2 hours

Overview

Build a simple Employee Management System — a CRUD (Create, Read, Update, Delete) web application for managing employee records. This assessment is designed to be completed in 2 hours, so keep your solution focused and functional rather than feature-heavy.

Requirements

1. Homepage — Employee List

Display a table of all employees with the following columns:

- Employee No
- Employee Name
- Designation
- Salary
- Edit (action)
- Delete (action)

2. Add Employee

At the top-right of the page, include a “+ Add Employee” button. Clicking it should open a form (modal or separate page — your choice) with the following fields:

Field	Type	Required	Notes
Employee No	Auto-generated or text	Yes	Unique. Auto-increment is acceptable.
Employee Name	Text	Yes	Non-empty string.
Designation	Text	Yes	Free text (e.g. “Software Engineer”).
Salary	Number	Yes	Positive number. Decimals allowed.

Submitting the form should create a new employee record and reflect it in the table immediately.

3. Edit Employee

Clicking Edit on a row should let the user update that employee's Name, Designation, and Salary, and save the changes back to the table.

4. Delete Employee

Clicking Delete on a row should remove that employee record. A confirmation prompt before deletion is recommended but optional.

Technical Constraints

- Frontend: any framework or library of your choice (React, Vue, Angular, plain HTML/CSS/JS, etc.)
- Backend: any framework or language of your choice (Node.js, Python, Java, PHP, .NET, etc.) — or a backend-as-a-service (e.g. Firebase, Supabase) if you prefer
- Database: any database of your choice (PostgreSQL, MySQL, MongoDB, SQLite, etc.)
- Data must persist — a refresh should not wipe out added/edited/deleted records

Submission Instructions

1. Push your complete source code to a GitHub repository.
2. Make the repository public.
3. Deploy the application to a free hosting platform (Vercel, Netlify, Render, Railway, etc.).
4. Submit both links: the public GitHub repo URL and the live deployed app URL.

Deliverables Checklist

#	Deliverable
1	Public GitHub repository link containing the full source code.
2	Live deployed application link (Vercel, Netlify, Render, Railway, or any platform of your choice).
3	A README in the repo with setup instructions and the tech stack used.

Evaluation Snapshot

This is a general guide to what we'll be reviewing — not an exhaustive rubric:

Area	What we're looking for
Functionality	All four CRUD operations work correctly end-to-end.
Code quality	Clean, readable, reasonably organized code.
UI/UX	Matches the required layout and is usable without instructions.

Area	What we're looking for
Deployment	Live link works and reflects the latest code.

Notes

- Given the 2-hour window, prioritize working CRUD functionality over polish.
- Styling can be minimal — a clean, usable table and form are sufficient.
- If you run out of time, a partially complete but working app is better than an incomplete, broken one. Briefly note in your README what's missing.
- Use of AI coding assistants is permitted unless you're told otherwise — check with your recruiter contact if unsure.
